

# MSU @ KS State Fair '12

With about 200 volunteers over a 10-day period, we were able to perform over 2300 free screenings! Of the 470 pediatric vision screenings, 231 were found with concerns. Many children do not complain of any vision “problems” because they have no way of knowing that their vision may not be normal—it is “normal” to them because it’s the only vision they know. Early detection can prevent both educational and behavioral struggles due to poor vision. MSU offers free screenings all over the State of Kansas; find one near you at health fairs, Lion’s Clubs, schools, and festivals!
